Report Documentation Page				Form Approved OMB No. 0704-0188	
Public reporting burden for the collection of information is estimated to average 1 hour per response, including the time for reviewing instructions, searching existing data sources, gathering and maintaining the data needed, and completing and reviewing the collection of information. Send comments regarding this burden estimate or any other aspect of this collection of information, including suggestions for reducing this burden, to Washington Headquarters Services, Directorate for Information Operations and Reports, 1215 Jefferson Davis Highway, Suite 1204, Arlington VA 22202-4302. Respondents should be aware that notwithstanding any other provision of law, no person shall be subject to a penalty for failing to comply with a collection of information if it does not display a currently valid OMB control number.					
1. REPORT DATE OCT 2004		2. REPORT TYPE		3. DATES COVERED 00-00-2004 to 00-00-2004	
4. TITLE AND SUBTITLE An Update on the HYCOM Solar Radiation Penetration Scheme				5a. CONTRACT NUMBER	
				5b. GRANT NUMBER	
				5c. PROGRAM ELEMENT NUMBER	
6. AUTHOR(S)				5d. PROJECT NUMBER	
				5e. TASK NUMBER	
				5f. WORK UNIT NUMBER	
7. PERFORMING ORGANIZATION NAME(S) AND ADDRESS(ES) Naval Research Laboratory,Stennis Space Center,MS,39529				8. PERFORMING ORGANIZATION REPORT NUMBER	
9. SPONSORING/MONITORING AGENCY NAME(S) AND ADDRESS(ES)				10. SPONSOR/MONITOR'S ACRONYM(S)	
				11. SPONSOR/MONITOR'S REPORT NUMBER(S)	
12. DISTRIBUTION/AVAILABILITY STATEMENT Approved for public release; distribution unlimited					
13. SUPPLEMENTARY NOTES 8th HYCOM NOPP GODAE Meeting, Oct. 27-29, 2004, RSMAS, Miami, FL					
14. ABSTRACT					
15. SUBJECT TERMS					
16. SECURITY CLASSIFICATION OF:			17. LIMITATION OF ABSTRACT Same as Report (SAR)	18. NUMBER OF PAGES 13	19a. NAME OF RESPONSIBLE PERSON
a. REPORT unclassified	b. ABSTRACT unclassified	c. THIS PAGE unclassified			

Contents

- HYCOM subsurface heating parameterization
 - (1) Longwave radiation*
 - (2) Shortwave radiation
 - (3) Latent heat flux
 - (4) Sensible heat flux

Bulk Heat Flux Parameterization

- Total heat flux is available from archived products
 - SST drifts if total flux alone is used to force an OGCM
- HYCOM uses model SST and a bulk heat flux parameterization
- Feedback between SST and heat flux to prevent SST drift
- No need for explicit relaxation to SST
- MICOM uses constant exchange coefficients
- HYCOM has
 - several options for exchange coefficients
 - a blackbody longwave correction

Subsurface Heating Parameterization

- Net heat flux at a given depth, z :

$$Q(z) = Q(0) + [Q_{\text{SW}}(0) - Q_{\text{sw}}(z)], \quad (1)$$

- Net heat flux absorbed at the sea surface, $z = 0$:

$$Q(0) = Q_{\text{LW}} + Q_L + Q_S, \quad (2)$$

- Q_{LW} : net longwave radiation at the sea surface,
- Q_{SW} : net shortwave radiation at the sea surface,
- Q_L : latent heat flux,
- Q_S : sensible heat flux.

- NOTE:

- HYCOM's "surface" heat flux is not $Q(0)$, but
- rather the near surface flux absorbed in layer 1
- e.g., $Q(1)$ when the top model layer is 1 m thick.

(1) Longwave Radiation

- Input from archived products (e.g., ECMWF, NCEP, etc)
- A correction is needed. Why ?
 - They use their model SST
 - Different from HYCOM SST
- HYCOM uses a **blackbody correction** (Kara et al 2004a):

$$Q_{\text{LW}}(T_s) = Q_{\text{LW}}(T_{sa}) - (4.506 - 0.0554 T_s)(T_s - T_{sa}).$$

- T_s : HYCOM SST
- T_{sa} : Atmospheric model SST
- The effects of clouds are independent of SST

A linear approximation to the blackbody radiation

- Cubic formulation (Josey et al. 2003)
- Linear approximation (Kara et al. 2004a)

(2) Shortwave Radiation

- Previous parameterizations in HYCOM
 - Jerlov water types (Halliwell 2004)
 - 2–band scheme (Kara et al. 2004b)
 - Turbidity–dependent split: red and blue spectrums.
 - Based on SeaWiFS k_{PAR} climatology (2004c).
 - Attenuation coefficient, k_{PAR} : **depth–independent**
- New parameterization in HYCOM (in progress)
 - Fixed frequency ranges:
 - visible spectrum (350–700 nm), also called PAR
 - infrared spectrum (700–2400 nm)
 - Will use absorption and backscattering coefficients
 - k_{PAR} depends on **depth and solar angle**

The shortwave radiation at a given depth (z) is split into two parts:

$$Q_{\text{SW}}(z) = Q_{\text{PAR}}(z) + Q_{\text{IR}}(z), \quad (3)$$

$$Q_{\text{PAR}}(z) = Q_{\text{PAR}}(0) \exp(-z k_{\text{PAR}}), \quad (4)$$

$$Q_{\text{IR}}(z) = Q_{\text{IR}}(0) \exp(-z k_{\text{IR}}), \quad (5)$$

(3) Latent Heat Flux

- Bulk formulation: $Q_L = \rho_a C_L L V_a (q_a - q_s)$
- Previous exchange coefficient (C_L) in HYCOM (Kara et al. 2002):
 - based the COARE (v2.6) algorithm (Fairall et al. 1996)
 - excluded $V_a < 4 \text{ m s}^{-1}$, $V_a > 20 \text{ m s}^{-1}$
 - C_L was dependent on $(T_a - T_s)$ and V_a
- New C_L parameterization in HYCOM (Kara et al. 2004d)
 - based on the COARE (v3.0) algorithm (Fairall et al. 2003)
 - includes V_a from 1 to 40 m s^{-1}
 - C_L is dependent on $(T_a - T_s)$, V_a , and RH as well
- NOTE: Calculate Q_L using HYCOM SST at each time step

Previous exchange coefficients for the latent heat flux (RH=100%)

New exchange coefficients for the latent heat flux (for varying RH)

Is including relative humidity in C_L important?

What could be the typical error in latent heat flux without RH?

	Latent heat flux (W m^{-2})		
	$V_a = 1 \text{ m s}^{-1}$	$V_a = 2 \text{ m s}^{-1}$	$V_a = 6 \text{ m s}^{-1}$
100%	1.9	5.7	50.1
80%	2.1	6.5	52.6
60%	3.4	7.2	54.3
40%	6.6	8.0	56.2
20%	11.8	8.9	58.0
00%	15.9	10.3	58.9

$$Q_L = \rho_a C_L L V_a (q_a - q_s) \quad , \quad \text{where } T_a - T_s = 2^\circ\text{C}, \quad q_a - q_s = 3 \text{ g kg}^{-1}$$

Summary

- Global HYCOM simulation with
 - the RH-dependent exchange coefficients
 - the depth-dependent shortwave radiation
- Shortwave radiation attenuation:
 - need two satellite-based input fields for HYCOM
 - (1) absorption coefficient
 - (2) backscattering coefficient
 - form a climatology (2001–2003) using MODIS

MODIS: Moderate Resolution Imaging Spectroradiometer
